

DATA CLEANING AND TRANSFORMATION OBSERVATION

Overview:

This project showcases data cleaning and transformation in Excel Power Query, including duplicate removal, data standardization, missing value handling, and dataset preparation for analysis.

Observation workflow:

Loaded the data to Power Query through **Data-> Get data-> from Table /Ranges**

1. Removing Duplicates:

Removed the duplicates by selecting the column Product ID which has most unique values and options in query, **Remove rows-> Remove duplicates**

2. Correcting the inconsistent Data:

- Identified the incorrect data in the column Category and Product name by filtering the columns
 - ✓ Inconsistent data- Electroni, laptop, smartphone, headphone
- Corrected the inconsistent data into valid one by selecting the related columns **Transform-> Replace Values**

Table1 - Power Query Editor

File Home Transform Add Column View

Transpose Data Type: Text * Replace Values * Unpivot Columns * Merge Columns * Statistics * Trigonometry * Date * Time * Duration * Expand * Aggregate * Create Data Type

Group By Use First Row as Headers * Count Rows * Rename * Pivot Columns * Convert to List * Split Column * Format * Extract * Parse * Text Column * Number Column * Date & Time Column * Structured Column

Queries [1] Table1

Table.ReplaceValue(#"Removed Duplicates", "Electroni", "Electronics", Replacer.ReplaceValue, {"Category"})

Product ID	Product Name	Brand Name	Price (\$)	Quantity	Category
1 28-JAN-US	Laptop	Dell		1000	30 Electronics
2 15-FEB-US	Sneaker				
3 03-MAR-US	Coffee				
4 11-APR-US	smartp				
5 22-MAY-US	Backpak				
6 07-JUN-UK	Headph				
7 19-JUL-UK	T-shirt				
8 23-AUG-UK	Blender				
9 05-SEP-UK	Tablet				
10 14-OCT-UK	Hiking B				
11 17-JUN-IN	Laptop				
12 25-NOV-AU	Sneaker

Removed Duplicates

Corrected inconsistent category

Corrected the Product names

Corrected the Product name

Corrected the Product name 2

3. Splitting and Merging Data:

There is need of manufacturing date , country code. Therefore, separated this information from the Product ID by using Transform-> Split columns

- Duplicated the column to convert by Add column option

- Selected the Split column by Delimiter, since the code and date are segregated by “-” delimiter

- Merged the Product name and Brand name, inserted new column as “Product Brand”

The screenshot shows the Power Query Editor interface. A table with the following data is visible:

	Price (\$)	Quantity	Category	Manufacturing Date	Country Code	Product
1	1000	30	Electronics	28-01-2026	US	Laptop-Dell
2	80	15	Fashion	15-02-2026	US	Sneakers-Ni
3	130	40	Kitchen	03-03-2026	US	Coffee Maki
4						
5						
6						
7						
8						
9						
10						
11						
12						
13						
14						
15						
16						
17	200	15	Electronics	20-08-2026	CN	smartwatch
18	980	10	Electronics	27-01-2026	IT	Laptop-Asus
19	150	15	Fashion	01-03-2026	UK	Sunglasses-t
20	null	10	Outdoor	14-08-2026	US	Camping Tei
21	700	50	Electronics	14-05-2026	RU	Camera-Niki
22	80	20	Kitchen	09-01-2026	CA	Microwave-
23	150	30		19-07-2026	BR	Fitness Traci
24	800	45	Electronics	29-09-2026	CA	Smartphone
25	null	25	Fashion	03-06-2026	CA	Sunglasses-t
26	400	40	Kitchen	11-07-2026	CA	Blender-Vit

The 'Merge Columns' dialog box is open, showing the following settings:

- Choose how to merge the selected columns.
- Separator: --Custom--
- New column name (optional): Product Brand

4. Number Formatting:

- Already the manufacturing Date is formatted as “DD-MM-YYYY”. So , no need of changing it
- For the Price column , changed the format type by using format type option

The screenshot shows the Power Query Editor interface. The 'Price (\$)' column is selected, and the 'Format' dropdown menu is open, showing the following options:

- 1.2 Decimal Number
- \$ Currency
- 123 Whole Number
- % Percentage
- Date/Time
- Date
- Time
- Date/Time/Timezone
- Duration
- Text
- True/False
- Binary
- Using Locale...

The 'Currency' option is selected.

5. Handling Missing Values:

- Identified the null values in the Category and Price columns in power query

- Additionally, Excel functions can be used to determine the number of blank cells in each column and the overall count of blank values in the dataset
- Total of count the blank cells used formula=COUNTBLANK(Sales_Data[#All])
- To fill the missing values , we need to count by column wise ,
- Formula(s) used for the column wise blanks,
 - ✓ COUNTBLANK(Sales_Data[Product ID])
 - ✓ COUNTBLANK(Sales_Data[Product Name])
 - ✓ COUNTBLANK(Sales_Data[Brand Name])
 - ✓ COUNTBLANK(Sales_Data[Price (\$)])
 - ✓ =COUNTBLANK(Sales_Data[Quantity])
 - ✓ =COUNTBLANK(Sales_Data[Category])
- Filled the missing values by using the mode statistics option in the category column
 - ✓ Transform->Group by -> Category

	Category	Count
1	Electronics	12
2	Fashion	6
3	Kitchen	5
4	null	4
5	Accessories	2
6	Outdoor	2

- By mode Statistics, more often data points will be used for the null values. So filled the null values in category with Electronics
- **Alternative option:** If the data points are missed in most of columns means we can name as Unknown, else we can delete the row to reduce the error rate
- Close and loaded the data into Excel
- We can categorize the product name by similar products name
- By conditional formatting , we can find the duplicate values in the product name and change the category based on the existing similar Category

- Through that, Sorted the product name and matched the valid category for the products

03-MAR-US	03-03-2026	US	Coffee Maker-Keurig	Coffee Maker	Keurig	130	40	Kitchen
08-DEC-DE	08-12-2026	DE	Coffee Maker-Nespresso	Coffee Maker	Nespresso	120	35	Electronics
15-FEB-US	15-02-2026	US	Sneakers-Nike	Sneakers	Nike	80	15	Fashion
25-NOV-AU	25-11-2026	AU	Sneakers-Adidas	Sneakers	Adidas	90	40	Electronics

- To Fill the Price value, the conditional functions are used. Since, the Product price have far outliers while comparing the category
- So , the average value for all the null values won't be suitable
- By using below formula, filled the null values in the price by category,

✓ IF(ISBLANK([@[Price(\$)]]),AVERAGEIF([Category],[@Category],\$G\$2:\$G\$32),[@[Price (\$)]])

6. Conditional Formatting:

- Highlighted the Electronics category by using the Conditional Formatting-> highlighted cell rules-> text that contains

- Using the conditional formatting, applied the data bar conditional formatting in the "Price" column
